TWIS Block Cipher

- A lightweight block cipher
- Key Size/Block Size: 128 bits
- 2-Branch Generalized Feistel Network
- 10 Rounds

TWIS Algorithm

G-Function

- G-Function is the round function of the algorithm

F-Function

- F -Function is the core of the G -function
- Consists of S-Box and a permutation

S-Box

- 6x8 S-Box
- 8-bit input $I \rightarrow I \wedge 0x3f \rightarrow 6\text{-bit}$

Table: S-Box

	0	1	2	3	4	5	6	7	8	9	a	b	c	d	e	f
0	90	49	d1	c6	2f	33	74	fb	95	6d	82	ea	0e	b0	a8	1c
1	28	d0	4b	92	5c	ee	85	b1	c4	0a	76	3d	63	f9	17	af
2	bf	bf	19	65	f7	7a	32	20	16	ce	e4	83	9d	5b	4c	d8
3	ee	99	2e	f8	d4	9b	0f	13	29	89	67	cd	71	dd	b6	f4

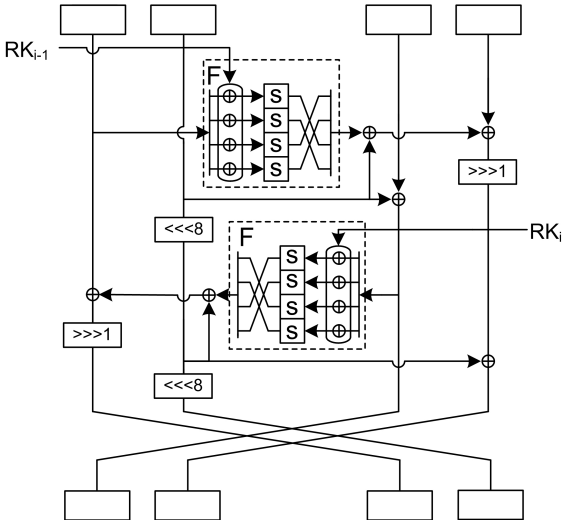

S-Box

- 6x8 S-Box
- 8-bit input $I \rightarrow I \wedge 0x3f \rightarrow 6\text{-bit}$

Table: S-Box

	0	1	2	3	4	5	6	7	8	9	a	b	c	d	e	f
0	90	49	d1	c6	2f	33	74	fb	95	6d	82	ea	0e	b0	a8	1c

3	ee	99	2e	f8	d4	9b	0f	13	29	89	67	cd	71	dd	b6	f4

Alternative Round Function

Key Schedule

- Key schedule generates 11 subkeys
- NFSR which uses an S-Box and a diffusion matrix

$$M = \begin{pmatrix} 0x01 & 0x02 & 0x04 & 0x06 \\ 0x02 & 0x01 & 0x06 & 0x04 \\ 0x04 & 0x06 & 0x01 & 0x02 \\ 0x06 & 0x04 & 0x02 & 0x01 \end{pmatrix}$$

Key Schedule

Outline

- 1 Description of TWIS
- 2 Differential Cryptanalysis**
- 3 Impossible Differential Analysis
- 4 Observations
- 5 Conclusion

Overview of the Differential Attack

- Attack on 10-Round TWIS
- Exclude final key whitening
- 9.5-Round Characteristic
- Recover 12 bits of 32-bit round subkey

Properties

Property 1:

The first two bits of the S-Box input is ignored: $O = S(I \wedge 0x3f)$.

Property 2:

Input differences $0x01$ and $0x25$ produce zero output differences with probability 2^{-5} .

9.5-round Differential Characteristic

- First find a 4-round characteristic of probability 1 using *Property 1*.

9.5-round Differential Characteristic

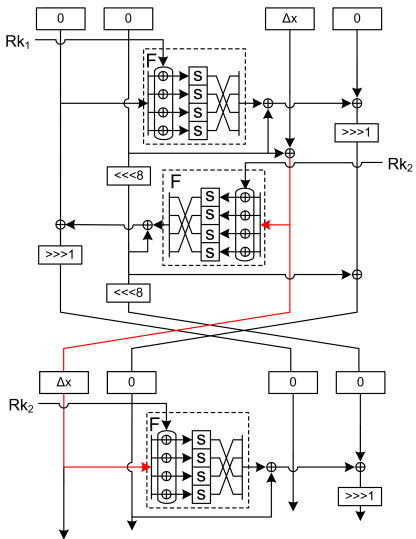

- Then, extend the characteristic by appending rounds to the beginning and the end
- Use *Property 2* in order to decrease the number of active S-Boxes

9.5-round Differential Characteristic

Rounds	Δ_{l_0}	Δ_{l_1}	Δ_{l_2}	Δ_{l_3}	# Active S-boxes	I/O Diff. for S-box	Probability
1	02000000 _x	00000000 _x	00000000 _x	0000A600 _x	1	0x02 → 0xA6	2^{-4}
2	00000000 _x	00000000 _x	01000000 _x	00000000 _x	1	0x01 → 0x00	2^{-5}
3	01000000 _x	00000000 _x	00000000 _x	00000000 _x	1	0x01 → 0x00	2^{-5}
4	00000000 _x	00000000 _x	00800000 _x	00000000 _x	0	-	1
5	00800000 _x	00000000 _x	00000000 _x	00000000 _x	0	-	1
6	00000000 _x	00000000 _x	00400000 _x	00000000 _x	0	-	1
7	00400000 _x	00000000 _x	00000000 _x	00000000 _x	0	-	1
8	00000000 _x	00000000 _x	00200000 _x	00000000 _x	1	0x20 → 0x83	2^{-4}
9	00200000 _x	00000000 _x	80000041 _x	00000000 _x	2	0x20 → 0x83 0x01 → 0x00	$2^{-5} \cdot 2^{-4}$
9.5	80000041 _x	80000041 _x	00100000 _x	00000000 _x	1	0x01 → 0x00	2^{-5}
	80000041 _x	00004180 _x	80100041 _x	C0000020 _x	-	-	-

The total probability is 2^{-32} .

9.5-round Differential Characteristic

9.5-round Differential Characteristic

Rounds	Δ_{l_0}	Δ_{l_1}	Δ_{l_2}	Δ_{l_3}	# Active S-boxes	I/O Diff. for S-box	Probability
1	02000000 _x	00000000 _x	00000000 _x	0000A600 _x	1	0x02 → 0xA6	2 ⁻⁴
2	00000000 _x	00000000 _x	01000000 _x	00000000 _x	1	0x01 → 0x00	2 ⁻⁵
3	01000000 _x	00000000 _x	00000000 _x	00000000 _x	1	0x01 → 0x00	1*
4	00000000 _x	00000000 _x	00800000 _x	00000000 _x	0	-	1
5	00800000 _x	00000000 _x	00000000 _x	00000000 _x	0	-	1
6	00000000 _x	00000000 _x	00400000 _x	00000000 _x	0	-	1
7	00400000 _x	00000000 _x	00000000 _x	00000000 _x	0	-	1
8	00000000 _x	00000000 _x	00200000 _x	00000000 _x	1	0x20 → 0x83	2 ⁻⁴
9	00200000 _x	00000000 _x	80000041 _x	00000000 _x	2	0x20 → 0x83 0x01 → 0x00	2 ^{-5*}
9.5	80000041 _x	80000041 _x	00100000 _x	00000000 _x	1	0x01 → 0x00	1*
	80000041 _x	00004180 _x	80100041 _x	C0000020 _x	-	-	-

The total probability is reduced to 2⁻¹⁸.

Attack Procedure

- Take $N = c \cdot 2^{18}$ plaintext pairs P^i, P^{i*} s.t.

$$P^i \oplus P^{i*} = (02000000_x, 00000000_x, 00000000_x, 0000A600_x)$$

and obtain their corresponding ciphertexts C^i, C^{i*} .

- Check the first 64-bit and the last 32-bit ciphertext difference and keep the text pairs satisfying correct differences.
- Keep a counter for each possible value of the 12 bits of the subkey RK_{10} corresponding to the second and the fourth bytes.

Attack Procedure

- Take $N = c \cdot 2^{18}$ plaintext pairs P^i, P^{i*} s.t.

$$P^i \oplus P^{i*} = (02000000_x, 00000000_x, 00000000_x, 0000A600_x)$$

and obtain their corresponding ciphertexts C^i, C^{i*} .

- Check the first 64-bit and the last 32-bit ciphertext difference and keep the text pairs satisfying correct differences.
- Keep a counter for each possible value of the 12 bits of the subkey RK_{10} corresponding to the second and the fourth bytes.

Attack Procedure

- Take $N = c \cdot 2^{18}$ plaintext pairs P^i, P^{i*} s.t.

$$P^i \oplus P^{i*} = (02000000_x, 00000000_x, 00000000_x, 0000A600_x)$$

and obtain their corresponding ciphertexts C^i, C^{i*} .

- Check the first 64-bit and the last 32-bit ciphertext difference and keep the text pairs satisfying correct differences.
- Keep a counter for each possible value of the 12 bits of the subkey RK_{10} corresponding to the second and the fourth bytes.

Attack Procedure

- For each pair of plaintexts and their corresponding ciphertexts (C^i, C^{i*}) , increment the counter for the corresponding candidate subkey RK_{10} when the following equations holds:

$$F(C_0^i, RK_{10}) \oplus F(C_0^{i*}, RK_{10}) \oplus 00004180_x = 80000041_x \oplus (\Delta C_2^i \lll 1).$$

- Adopt the key with the highest counter as the right key.

Attack Procedure

- For each pair of plaintexts and their corresponding ciphertexts (C^i, C^{i*}) , increment the counter for the corresponding candidate subkey RK_{10} when the following equations holds:

$$F(C_0^i, RK_{10}) \oplus F(C_0^{i*}, RK_{10}) \oplus 00004180_x = 80000041_x \oplus (\Delta C_2^i \lll 1).$$

- Adopt the key with the highest counter as the right key.

Outline

- 1 Description of TWIS
- 2 Differential Cryptanalysis
- 3 Impossible Differential Analysis**
- 4 Observations
- 5 Conclusion

Impossible Differential Characteristic

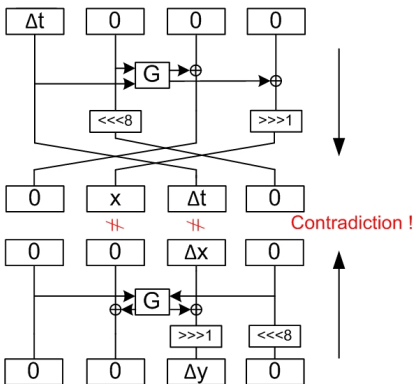

- Start with the difference $(0, 0, \Delta y, 0)$, $\Delta y = 00800000_x$
- Propagate this difference for 4.5 rounds
- Obtain the difference $(\Delta t, 0, 0, 0)$, $\Delta t = 00200000_x$
- 4.5-round differential characteristic with probability 1

- Start with the difference $(\Delta t, 0, 0, 0)$, $\Delta t = 00200000_x$
- Propagate backwards for 5 rounds
- Obtain the difference $(0, 0, \Delta x, 0)$, $\Delta x = 01000000_x$
- 5-round differential characteristic with probability 1

Impossible!

$$\Delta t = 00200000_x \neq 01000000_x = \Delta x$$

Possible Attack

- Add half round to this characteristic
- Guess the corresponding subkeys
- Eliminate the wrong key values

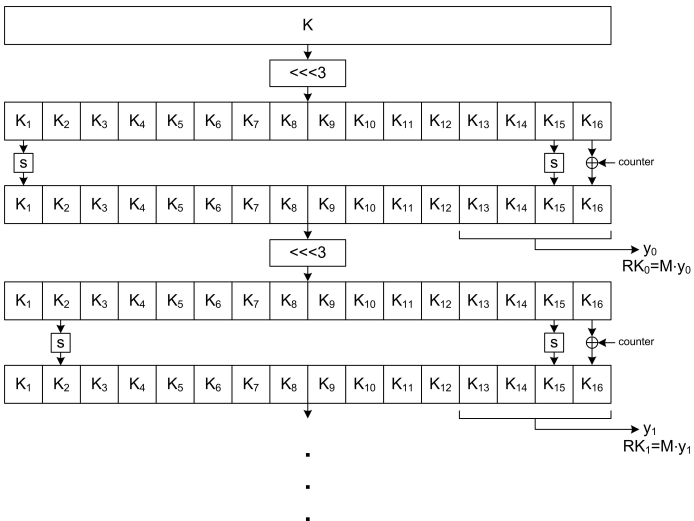

Outline

- 1 Description of TWIS
- 2 Differential Cryptanalysis
- 3 Impossible Differential Analysis
- 4 Observations**
- 5 Conclusion

Actual Key Size

- The key size of TWIS is 128 bits.
- However, not all the bits are used to generate subkeys:
 - First subkey is generated using the first 3 and last 29 bits
 - Remaining 10 subkey is generated by 3 left rotation

Key Schedule

Actual Key Size

Actual Key Size

- The key size of TWIS is 128 bits.
- However, not all the bits are used to generate subkeys:
 - First subkey is generated using the first 3 and last 29 bits
 - Remaining 10 subkey is generated by 3 right rotation
 - So, $3 + 29 + 3 \cdot 10 = 62$ bits of the master key is used
- Therefore, the security is 62 bits.

Actual Key Size

- The key size of TWIS is 128 bits.
- However, not all the bits are used to generate subkeys:
 - First subkey is generated using the first 3 and last 29 bits
 - Remaining 10 subkey is generated by 3 right rotation
 - So, $3 + 29 + 3 \cdot 10 = 62$ bits of the master key is used
- Therefore, the security is 62 bits.
 - The key scheduling uses the same S-Box with data processing.
 - Considering the eliminated bits by the S-Boxes, the security reduces to 54 bits.

Actual Subkey Size

- Also, the S-Box in the F -function eliminates the first two bits of the subkey.
- Therefore, the actual subkey size is 24 bits.

Key Whitening

The key whitening, which is introduced to increase security, is used in an in appropriate manner:

- RK_0 is XORed to the first 32-bit word.
- Then, this word is input to the F -function immediately where RK_0 is XORed again.

Key Whitening

Key Whitening

The key whitening, which is introduced to increase security, is used in an inappropriate manner:

- RK_0 is XORed to the first 32-bit word.
- Then, this word is input to the F -function immediately where RK_0 is XORed again.
- Therefore, key has no effect in the first G -function: one can proceed without knowing the key.

Key Whitening

- Moreover, as the key whitening, RK_2 is XORed to the 32-bit word that is affected by RK_{10} .
- If one can find both RK_2 and RK_{10} , he can get information about the subkeys inbetween by going forwards and backwards from RK_2 and RK_{10} respectively.

Weak Diffusion

- The diffusion of the keys among S-Boxes is very weak.
- One can analyze the 32-bit subkey as 4 independent 8-bit subkeys.
- The complexity of an ordinary exhaustive search will be 2^{24} .
- If, the search is on 4 8-bit subkeys, the complexity will be $4 \cdot 2^6 = 2^8$.

Outline

- 1 Description of TWIS
- 2 Differential Cryptanalysis
- 3 Impossible Differential Analysis
- 4 Observations
- 5 Conclusion**

Conclusion

- A differential attack on full-round TWIS
- Recover 12 bits of the 32-bit final subkey with 2^{21} complexity
- 9.5-round impossible distinguisher
- At most 54-bit security
- Weaknesses due to the use of subkeys during the encryption and the choice of whitening subkeys

Thank you for your attention!
